Applied Missing Data Analysis
SECOND EDITION

Craig K. Enders, PhD

"Thorough, cutting-edge, and far and away the clearest text available on missing data analysis. Written by a world-renowned expert who is a gifted instructor, this book is accessible enough for applied researchers with introductory statistics and regression knowledge, is an outstanding text for a missing data course, or can be used to fill gaps in methodologists' understanding of the notoriously opaque missing data literature. For researchers who learned 'modern' missing data handling methods 10 or 20 years ago—much has changed. For instance, the second edition will bring you up to speed on how to: accommodate missingness in conjunction with nonnormal and discrete outcomes, nonlinear and interactive relationships, and multilevel structures; choose among non-model-based versus model-based multiple imputation methods; and conceptualize and implement sensitivity analyses to assess the impact of alternative missing data assumptions. Reading this book feels like being guided by the author through a comprehensive one-on-one workshop. A gift to the field!"   **—Sonya K. Sterba, PhD**

The most user-friendly and authoritative resource on missing data has been completely revised to make room for the latest developments that make handling missing data more effective. The second edition includes new methods based on factored regressions, newer model-based imputation strategies, and innovations in Bayesian analysis. State-of-the-art technical literature on missing data is translated into accessible guidelines for applied researchers and graduate students. The second edition takes an even, three-pronged approach to maximum likelihood estimation (MLE), Bayesian estimation as an alternative to MLE, and multiple imputation.

2022, 7" x 10" Hardcover, 546 Pages,
ISBN 978-1-4625-4986-3, $75.00
SPECIAL PRICE: $60.00
